

## CITY BUS

CityBus is a modern mobile app template designed for building real-time bus tracking, public transportation, and shuttle service applications. The template includes dedicated Rider and Driver modules that streamline communication and trip management across the transit ecosystem. Riders can track buses in real time, view estimated arrival times, access route information through interactive maps, receive travel reminders, and use referral features to enhance engagement. Drivers can share live locations, access route navigation tools, and manage trips with start, pause, and end-trip controls. Built with a clean user interface, scalable architecture, and well-structured codebase, CityBus offers optimized performance and easy customization, making it an ideal foundation for developing smart transit and transportation management solutions.
